

hi, thanks for helping me! :)

so, there is mainly one issue with the start page of my website, everything else is ok and should stay as it is.

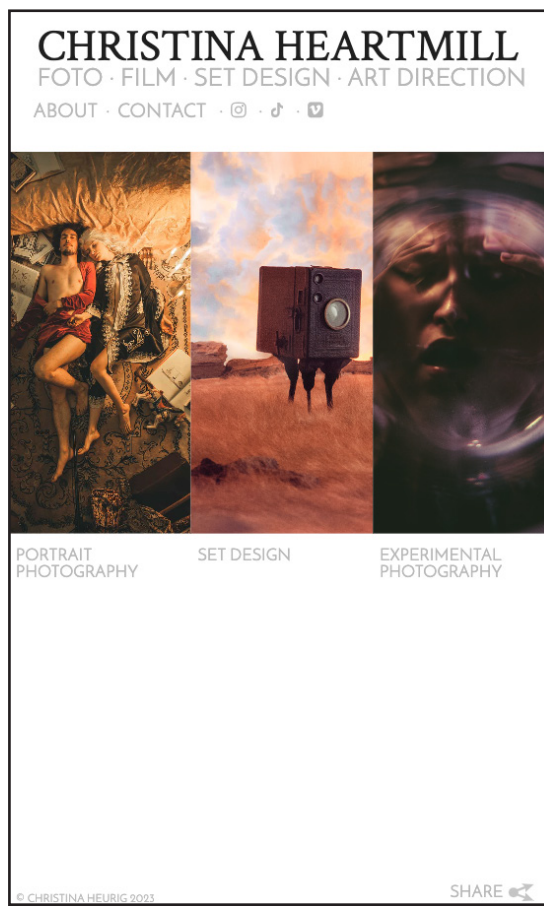

website: <https://www.heartmill.com/>

the start page NOW does look like this

1. desktop

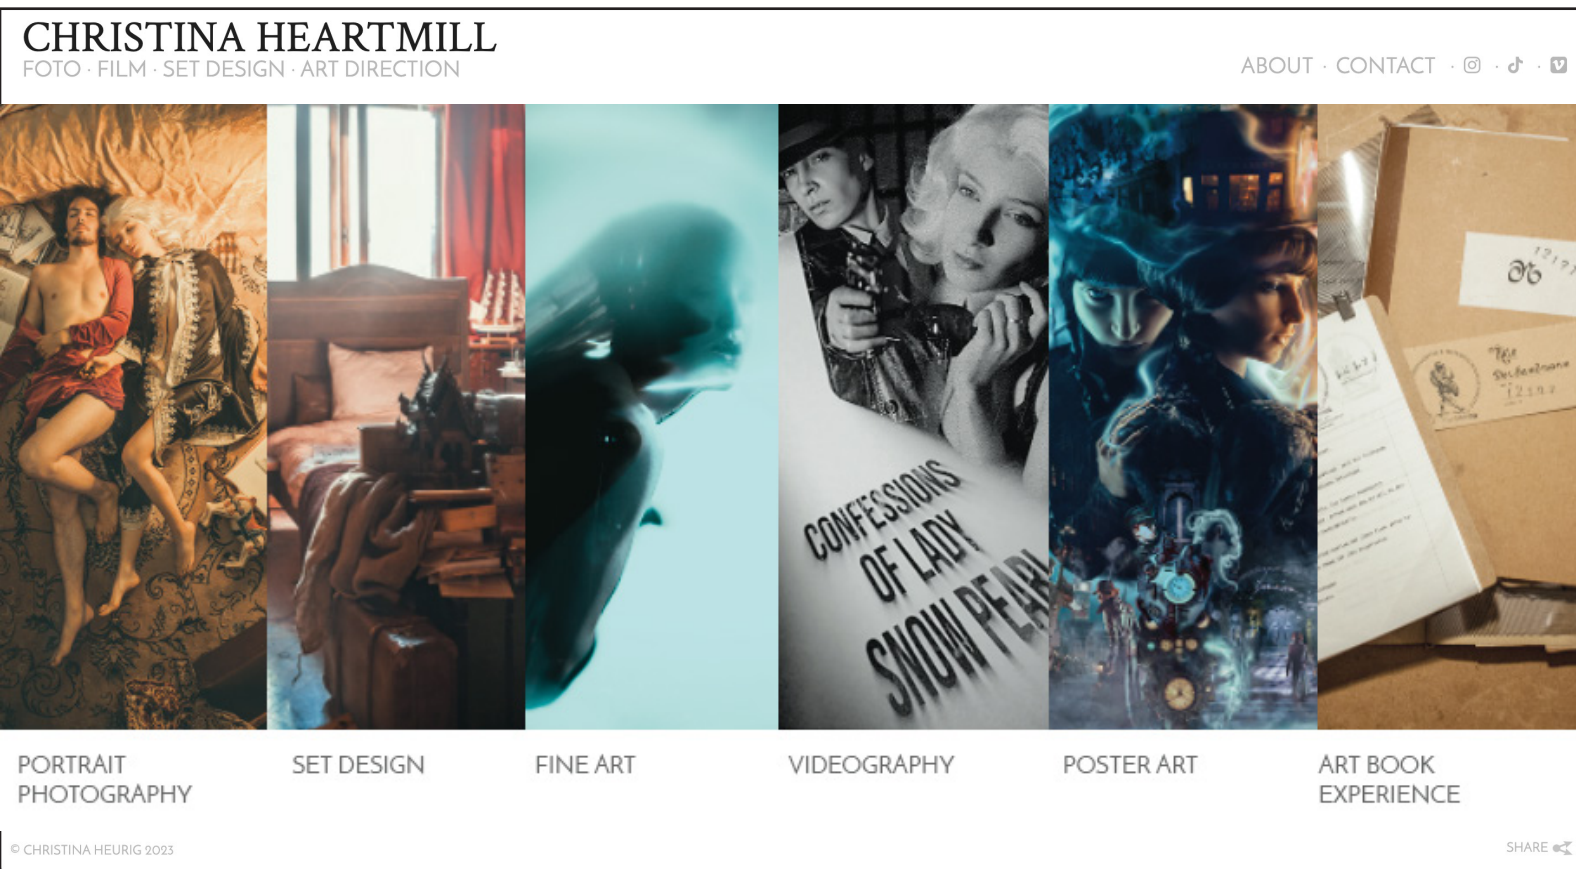

2. mobile phone:

BUT my needs have changed so NOW I need 6 columns instead of 3.
this will mean that you dive into the style.css file, because everything is made to be responsive (the website scales down and eventually becomes „mobile friendly“ layout).
so your task is to make the home page work to look like this:

desktop;

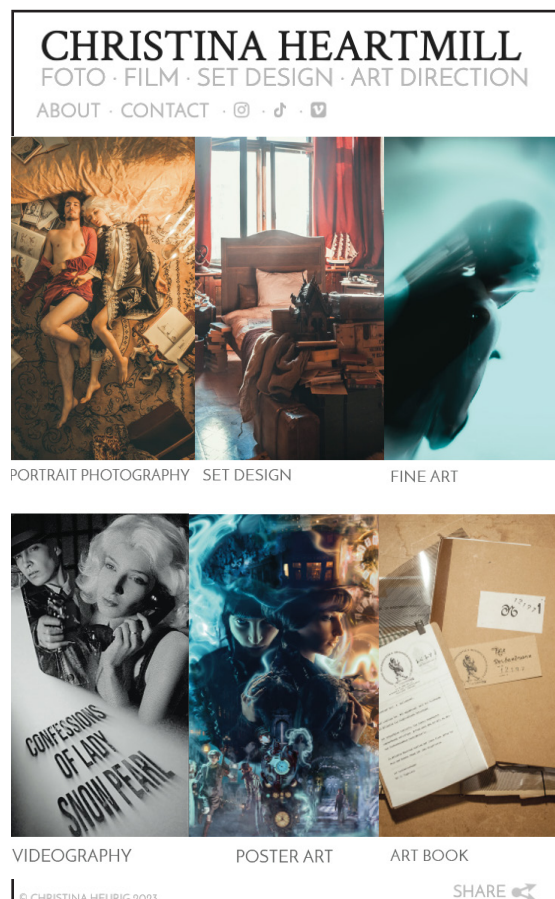

mobile phone:

the important thing is that the whole thing stays responsive no matter what.

you will realize, that as you shrink down the site (start page), at some point it switches to smaller fonts. this can help you to determine when the layout can SWITCH from the 6 columns (next to each other, desktop view), to the 3x2 grid (mobile view). it will help if you view the site on different screens/phones.

also keep in mind I can change text/images later alone, you just need to make it work in general and can insert any place holder.

i attached you the style.css file and the index.html file of the start page. you can work on these on your own computer, and I will upload them myself into the webhoster, so I don't have to share the password.

the website is basic HTML / css, no wordpress or whatever.

hope that helps!

thanks a lot for your help :))
